High-index Image Chain

The powerful digital radiography system integrates patients information collection, APR selection, Self-Diagnosis Function (SDF), exposure condition control and image post-processing.

Powerful Generator

400kHz high frequency generator provide strong foundation for stable x-ray output.

High-quality Detector

Detectors with highly sensitive Cesium Iodide (CsI) scintillators are available for high-contrast image quality as well as dose reduction.

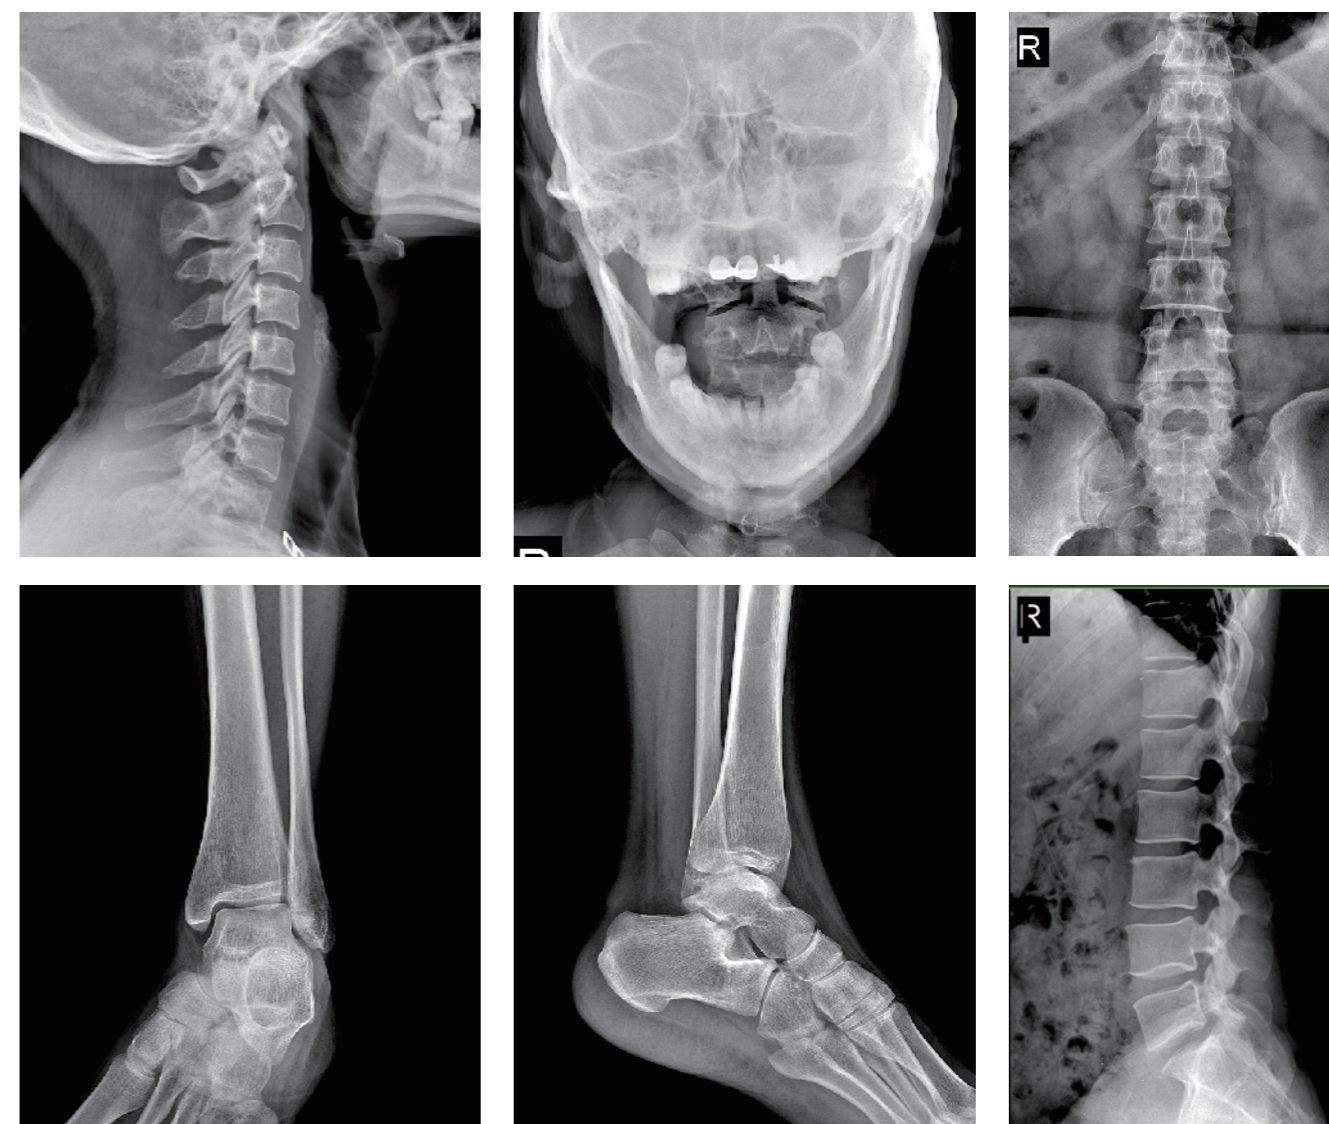

YW-F-6000

Sharp Imaging

The unique post-processing algorithm guarantees higher quality images and higher diagnosis efficiency.

Safe and Reliable

Self-test when the system is power on and the error code in the screen will help find out the cause quickly and efficiently when an error occurs.

Flexible Positioning

All-directional and multi-angle positionings can meet various needs of clinical examination and improve imaging efficiency.

More than 1,000 APRs and accurate control of exposure parameters ensure superior images.
